

Application No.: 10/560,589

RECEIVED  
CENTRAL FAX CENTER  
NOV 20 2009**AMENDMENTS TO THE CLAIMS:***Please amend the claims as follows:*

1. (Currently Amended) A light-emitting device comprising:
  - a first electrode;
  - a second electrode provided to be opposite to the first electrode; and
  - a light-emitting layer which contains a metal oxide semiconductor porous body, by the surface of which an organic light-emitting material is supported, and is provided between the first electrode and the second electrode,  
wherein the organic light-emitting material is chemisorbed to the surface of the metal oxide semiconductor porous body.
2. (Original) The light-emitting device according to claim 1, wherein the metal oxide semiconductor porous body is composed of a metal oxide semiconductor particulate powder.
3. (Original) The light-emitting device according to claim 2, wherein the metal oxide semiconductor particulate powder is made of an n-type semiconductor material.
4. (Cancelled)
5. (Previously presented) The light-emitting device according to claim 1, further comprising at least one organic layer provided between the first electrode and the second electrode in addition to the light-emitting layer, the organic layer containing an adhesive organic material so as to function as an adhesive layer through which adjacent upper and lower layers thereof are bonded together.
6. (Original) The light-emitting device according to claim 5, further comprising a spacer dispersed in the organic layer, by which the thickness of the organic layer is defined.
7. (Original) The light-emitting device according to claim 6, wherein the spacer is composed of transparent or semi-transparent particles.

**Application No.: 10/560,589**

8. (Previously presented) The light-emitting device according to claim 6, wherein the spacer is made of an insulating material.
9. (Previously presented) The light-emitting device according to claim 6, wherein the particle diameter of the spacer is in the range of 0.01 to 10  $\mu\text{m}$ .
10. (Original) The light-emitting device according to claim 5, wherein the adhesive organic material contained in the organic layer contains at least a polymer-based material.
11. (Previously presented) The light-emitting device according to claim 5, wherein the first electrode is an electron injection electrode, the second electrode is a hole injection electrode, and the organic layer is a hole transport layer, and wherein the hole transport layer functions as an adhesive layer through which adjacent upper and lower layers thereof are bonded together.
12. (Previously presented) The light-emitting device according to claim 5, wherein the first electrode is a hole injection electrode, the second electrode is an electron injection electrode, and the organic layer is a hole transport layer, and wherein the hole transport layer functions as an adhesive layer through which adjacent upper and lower layers thereof are bonded together.
13. (Previously presented) The light-emitting device according to claim 11, further comprising a hole injection layer provided between the hole injection electrode and the hole transport layer.
14. (Previously presented) The light-emitting device according to claim 11, further comprising an electron transport layer provided between the electron injection electrode and the light-emitting layer.
15. (Withdrawn) The light-emitting device according to claim 1, further comprising a thin film transistor connected to the second electrode.

**Application No.: 10/560,589**

16. (Withdrawn) The light-emitting device according to claim 15, wherein the thin film transistor is an organic thin film transistor composed of a thin film containing an organic material.

17. (Withdrawn) A display comprising:

a light-emitting device array in which the plurality of light-emitting devices according to claim 15 are two-dimensionally arrayed;

a plurality of x electrodes extending in parallel with each other in a first direction parallel to the surface of the light-emitting device array; and

a plurality of y electrodes extending in parallel with each other in a second direction parallel to the surface of the light-emitting device array and perpendicular to the first direction, wherein each of the thin film transistors of the light-emitting device array is connected to the x electrode and the y electrode.

18. (Withdrawn) The display according to claim 17, further comprising a region composed of a metal oxide semiconductor porous body by the surface of which a black dye is supported, by which the adjacent plurality of light-emitting devices two-dimensionally arrayed are separated from each other.

19-42. (Cancelled)
